

Environmental Investigation

Many environmental problems can be avoided by forward thinking and careful planning.

MRM Konsult AB has considerable experience in the field of environment consultancy and offers the following services:

Pollution Prevention: MRM Konsult AB can, for example, identify appropriate sites and carry out studies prior to the construction of new waste disposal facilities, assess the permeability of landfill barriers, determine exclusion zones for groundwater catchment areas, and conduct environmental impact assessments. MRM Konsult AB is also a recognised leader in the assessment of sulphide soils and offers a proprietary method for assessing the acidification sensitivity of sulphide soils prior to construction projects.

Contamination Assessments: MRM Konsult AB can conduct everything from desk studies and walkover surveys to detailed site investigation and qualitative/quantitative risk assessments for contaminated sites. MRM's expertise is not just limited to contaminated land issues, but also includes environmental impact assessments, PCB inventories, and environmental monitoring.

Remedial Activities: Whether the contaminant is organic or inorganic in nature, present at depth or at the surface, MRM Konsult AB can design, implement, and validate remediation strategies to suit the problem at hand.
